FILE PROCESSING

INTRODUCTION

File processing is one of the most important concepts in software development. Applications often need to store, retrieve, update, and manage data permanently. Python provides support for Text Files, CSV Files and JSON Files. The objective of Day 5 was to learn file processing techniques and develop an Employee Records Manager using JSON storage.

TOPICS COVERED

1. Text Files

- Reading text files
- Writing text files
- Appending content

2. CSV Files

- Reading CSV data
- Writing CSV data

3. JSON Handling

- Reading JSON files
- Writing JSON files
- Data serialization and deserialization

ASSIGNMENT

Employee Records Manager

DELIVERABLE

File-Based CRUD Application

PROJECT OVERVIEW

The Employee Records Manager is a file-based application developed using Python and JSON storage. The system allows users to Add, View, Update and Delete employee records while maintaining data persistence.

IMPLEMENTATION DETAILS

Create Operation – Add employee records.
Read Operation – Display employee records.
Update Operation – Modify employee information.
Delete Operation – Remove employee records.
Storage Mechanism – Store all records in employees.json.

FILES CREATED

- employee_manager.py
- employees.json
- README.md
- Day5_Internship_Report.pdf

LEARNING OUTCOMES

- Learned Python file handling techniques.
- Gained experience with JSON storage.
- Implemented CRUD operations.
- Understood persistent data storage concepts.
- Improved application design skills.

CONCLUSION

Successfully developed an Employee Records Manager using Python and JSON file processing. The application demonstrates CRUD operations while maintaining employee information using file-based storage.

STATUS

DAY 5 TASK COMPLETED SUCCESSFULLY ■
